-  **04** **Remote Control**
-  **05** **Hardware Interfaces**
-  **06** **Firmware Upgrades**
-  **07** **microSD Card**

1. Startup

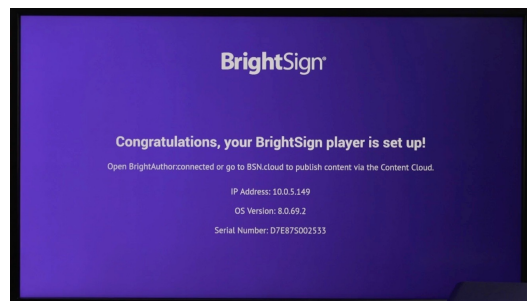

These screens will appear when the system starts up.

Splash screen

After connecting the system to power, the MOKA / BrightSign splash screen will be displayed.

If the system has already been set up and a presentation has been applied, the presentation will begin to play automatically.

Provisioning

If the system has not been set up, you will be guided through the BrightSign setup process, also known as provisioning.

A major part of the provisioning process is establishing the Publishing Mode which defines how content will be published / delivered to the system.

2. Signal Source

Internal

HDMI

Signal Sources

- **Internal**

This is the default signal from the internal BrightSign components. If a presentation has been applied, the presentation will automatically start playing when the system is powered on.

- **HDMI**

When an active HDMI device is connected, the system will automatically switch to the signal from this device.

Switching Signal Sources

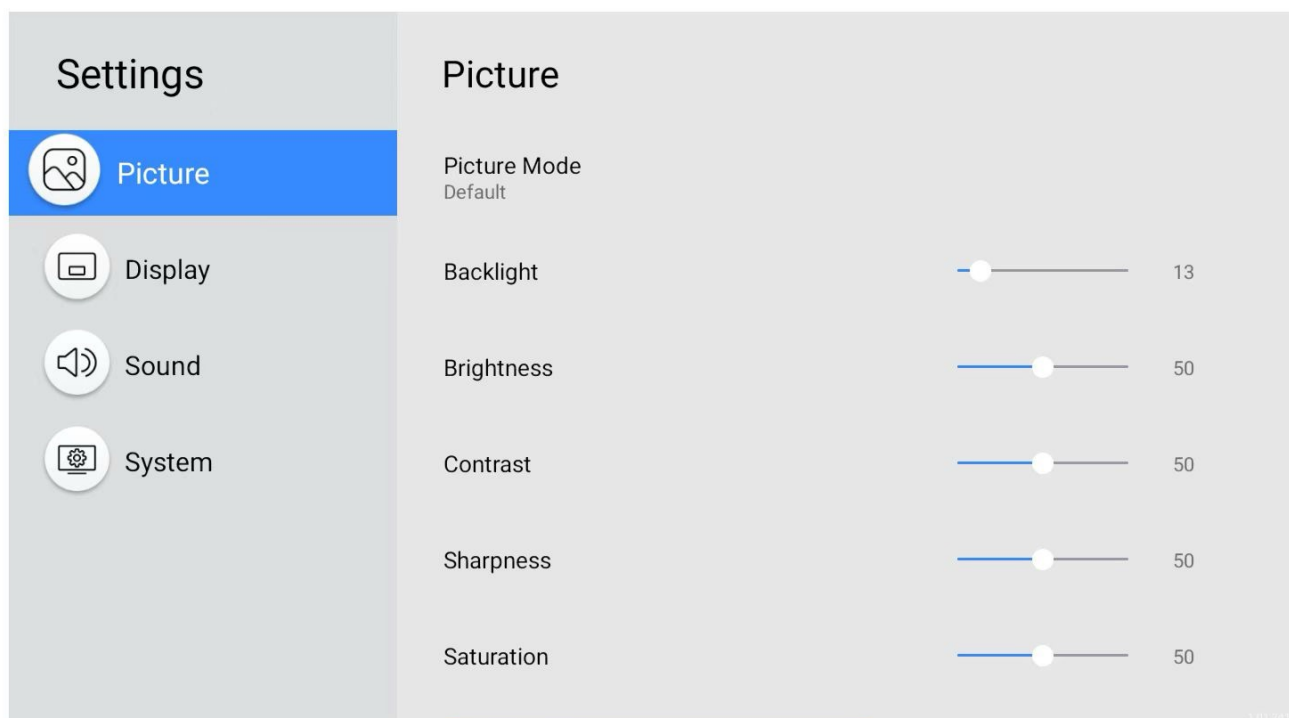

- **Remote control**

Use the “Source” button to select the desired signal source.

- **Automatic switching:**

When an active HDMI device is connected, the system will automatically switch to the signal from that device. When the HDMI device is removed, the system will switch back to the internal BrightSign signal.

3. Settings

Use the "Settings" button  on the remote control to configure the various settings.

3. Settings - Picture

Picture Mode

- Standard
- Vivid
- Soft
- Movie
- Monitor
- Game
- User

- Display Firmware Version
- MAC Address
- WiFi MAC Address
- BrightSign Serial No.
- BrightSignOS Version
- Hardware Revision

Power

Auto Off

- Off, 15 min, 30 min, 45 min, 60 min

When the display is inactive (no source signal is detected), the display and network connection will automatically turn off after the indicated amount of time. If the Always Connected setting is enabled, the display will turn off after the indicated amount of time, but the network connection will remain active.

Auto On

- Enabled / Disabled

When enabled, the display and network connection will automatically turn on when the device is plugged in. When disabled, the display and network connection will turn on when the device is plugged in, and the Power button is pressed.

HDMI Wake

- Enabled / Disabled

When enabled, connecting an active HDMI device will automatically turn the system on. When disabled, connecting an active HDMI device will have no effect if the system or display is off.

Always Connected

- Enabled / Disabled

Enabling this is recommended for digital signage use.

When enabled, pressing the Power button turns the display on and off. The network connection remains active, allowing software updates, content downloads, and remote management. When disabled, pressing the Power button turns the display and network connection on and off.

This setting uses more power when enabled than when disabled.

Reset

Resets all System settings to the default settings.

4. Remote Control

Buttons

- **Power:** Turn the system on or off
- **Home:** Return to the main menu
- **OK:** Confirm the selection
- **Back:** Return to the previous screen
- **Volume:**
 - "+" to increase volume
 - "-" to decrease volume
- **Mute:** Press to mute / unmute
- **Navigation:** Up, down, left, right
- **Signal Source:** Change between internal and external signal source
- **Settings:** Access settings

Interfaces

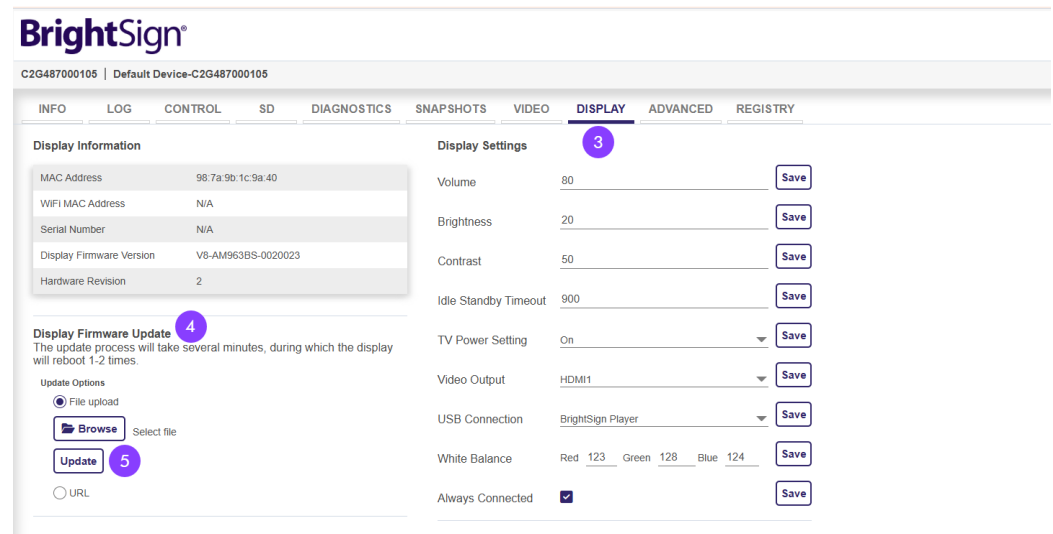

6. Display Firmware Update (LDWS)

The system's Local Diagnostic Web Server (LDWS) can be used to update the display firmware over the local network.

1. Determine the system's IP address by booting up the system without a storage device. The IP address will be displayed on the screen.
2. Access the LDWS by entering the IP address into a web browser's address bar.
3. While in the LDWS, click the DISPLAY tab.
4. Under Display Firmware Update, there are two options:
 - File upload
 - Upload a file from your computer.
 - URL
 - Enter the address of the URL-accessible file.
5. Click Update.

The update process will take several minutes, during which the display will reboot 1-2 times.

The screenshot shows the BrightSign web interface for device C2G487000105. The 'DISPLAY' tab is selected, showing 'Display Information' and 'Display Settings'. The 'Display Firmware Update' section is highlighted with a purple circle 4, showing 'File upload' as the selected option. The 'Update' button is highlighted with a purple circle 5. The 'Display Settings' section on the right has a purple circle 3 next to the 'Save' button for each setting.

Display Information	Value
MAC Address	98:7a:9b:1c:9a:40
WiFi MAC Address	N/A
Serial Number	N/A
Display Firmware Version	V8-AM963BS-0020023
Hardware Revision	2

Display Firmware Update 4
The update process will take several minutes, during which the display will reboot 1-2 times.

6. Display Firmware Update (RDWS)

The system's Remote Diagnostic Web Server (RDWS) can be used to update the display firmware over the internet. The system must be registered with BSN.Cloud.

1. From BrightAuthor:connected, click the Network tab and find the system in the list.
2. Click the "gear" icon to access the RDWS.
3. While in the RDWS, click the DISPLAY tab.
4. Under Display Firmware Update, enter the address of the URL-accessible file.
5. Click Update.

The update process will take several minutes, during which the display will reboot 1-2 times.

7. microSD Card

The system has minimal onboard storage and requires a microSD card (not included) for digital signage operation. A microSD slot is located at the bottom of the display.

Due to the continuous usage digital signage systems experience, BrightSign-qualified microSD cards are recommended. Please visit brightsign.biz/storage for more info.

A blurred background image of industrial machinery, likely a manufacturing or assembly line, with various metal components, pipes, and electrical conduits visible.

Together, Stronger!
